This paper presents the analysis of opinion holder and object positions in the structure of opinion in Russian news texts. Firstly, we extracted opinionated words from texts both manually and automatically using our own sentiment lexicon. Secondly, we highlighted opinion holder and object for each opinion-bearing

element, and examined their morphological and syntactic properties. The work also describes the sentiment lexicon basic structure and lists the main problems with which we faced while building it. The resulting data will later help us in building an algorithm for automatic extraction of object and opinion holder.
